

## Extracting single files from WMLite XP mode VMD file.

Posted by stawes - 2015/08/27 06:29

---

I need to get access to a single file in WMLite XP Mode VMD file.

How can I do that without having the used password when creating the VMD file?

On windows 7 and above, you can mount the vhd file, then you can browse and copy files.

THE VHD is mounted and all properties are good.

The problem is that I cannot Open or Browse the VHD. I assume that this is because that the VHD is password protected. Some way to verify this?

no, that password is only for login, you should be able to browse files.

Do you see a drive letter for the vhd? using disk manager to attach the vhd

I see 4 disk C:, D:, E: and the VHD file without any drive letter.

There are one command that gives possibilities to get access to the volume. Should i give just Name and letter or also the path to the already mounted volume?

3.9 GB are used out of 130 GB.

OK I have extracted the information I need.

I have uninstalled VMLite and tried to reinstall VMLite XP Mode following the documentation.

Things work fine until the very last action.

I get the error as showed in the link below.

Image say;

Cannot register the hard disk C:

A hard disk ... already exist in the media registry ...VirtualBox.xml

Error disk registration

How can I get this fixed?
